

PolySupport™

PolySupport™ is a material designed to solve one of the most intimidating problem in desktop FDM/FFF 3D printing: support. PolySupport generates support structures that can be easily removed by hand.

No More Hassle

PolySupport works just like your regular 3D printing filaments. Easy to print and store. No sensitivity to normal moisture or heat. No need to work with dangerous organic solvents.

Freedom of Creation

PolySupport is a material designed specifically to generate support structures that are adequate to support the part being built, and yet extremely easy to remove afterwards

Single & Dual Extruders

PolySupport can be used on both single extrusion printers as both the support and modeling material and dual-extrusion printers as a dedicated support material.
